TITLE: Apparatuses "SMT-34" and "TVCh-34" Without Transmission of Carrier Frequency Current Into the Line (Apparatura "SMT-34" i "TVCh-34" bez peredachi v liniyu toka nesushchey chastoty) ¹⁸

PERIODICAL: Vestnik svyazi, 1958, Nr 10, pp 6-9 (USSR)

ABSTRACT: In "Vestnik svyazi", 1956, Nr 1, the first stage of modernization of the apparatus "SMT-34" was described. There were still several drawbacks: the transmission of carrier frequency currents into the line, the low level of the signal, and the absence of automatic level control. In the article, an improved version of the "SMT-34" is described in which the effective transmitted frequency band is increased to 2,400 cycles while the carrier frequency is fixed at 300 cycles. A block diagram is given in Figure 2. The receiver amplifier consists of two cascades and contains two tubes (Figure 3). The automatic control may be changed to manual control in case of emergency.

TITLE: Surfacing parts of high-strength cast iron with a steel layer
using an electrode band

PERIODICAL: Avtomaticheskaya svarka, no.2, 1962, 20-26

TEXT: Results are given of experiments in which cylindrical specimens of magnesium-inoculated 84 40-10 (VCh 40-10) high-strength cast iron were surfaced with low-carbon steel, steel elements being subsequently welded to the steel coating. In previous welding experiments, it was found impossible to directly weld steel parts to cast iron of this type, because of the brittle carbide zone which forms in the fusion line; this was also observed by P.S. Bazhenov (Ref. 2: "Svarochnoye proizvodstvo", no.3, 1955) in experiments with steel, iron-nickel and magnesium-treated electrodes. The chemical composition of VCh 40-10 cast iron is (in %): 3.2-3.5 C, 0.2-0.5 Mn, 3.2-3.6 Si, 0.008-0.015 S, 0.037-0.048 P.

Card 1/3

S/125/62/000/002/003/010

D040/D113

Surfacing parts of high-strength cast ...

A low-carbon steel band of 0.8 or 1.0 grade per ГОСТ 503-41 (GOST 503-41) served as electrode and an АМ-60(AN-60) high-manganese flux was used. An АДС-1000-2 (ADS-1000-2) tractor operating on reversed-polarity current was used for welding. An electrode band, 0.4 x 70 mm in cross section, produced a smooth coating at 580-620 amp, 28-30 v, and 6-15 m/hr welding speed. For an electrode 0.25 x 40 mm in cross section, the proper current was 300-320 amp. A high-manganese AN-60 flux was used despite the resultant increased Mn content in the coating, since the shape of the coating was bad using two manganese-free fluxes АМ-28 (AN-28) and АМ-5 (AN-5). The coatings were applied in two layers, and steel parts welded to the steel coating by manual welding using УОННИ-13/55 (UONII-13/55) electrodes. Perlite-sorbite structure formed in the first layer at 13 m hr welding speed with 0.4 x 70 mm electrode band, and ferrite-perlite structure in the second layer. Experimental weldments weighing 200 kg were tested for strength of joints on a 100-ton tension test machine and a vibrating test stand. It was concluded that the strength of bond between the cast iron body and coating was five to seven times greater than the strength requirements for welded joints with steel parts. There are 4 figures, 3 tables and 6 Soviet references.

TITLE: Automation in the Coal-Mining Industry (Zadachi
avtomatizatsii v ugol'noy promyshlennosti)

PERIODICAL: v sb.: Avtomatizatsiya v ugol'n. pros-sti. Moscow,
Ugletekhnizdat, 1956, pp 3-10

ABSTRACT: The author gives a short analysis of the state of
automation of mine production in the coal-mining
industry of the USSR. At the mines of the Ministry
of the Coal-Mining Industry of the Ukr SSR automation
has been extended to principal ventilation, skip hoists,
high-voltage and low-voltage water-draining apparatus,
winches for continuous haulage, stationary conveyor
belts, etc. (data are given on the number of automatic
installations). The introduction of automation
permitted the freeing of nearly 1000 men in 1954 from
the operating personnel. The chief faults in the

Card 1/2

Automation in the Coal-Mining Industry (Cont.)

15-57-10-15005

automation of mine production are the lack of solutions to the problems of installation and maintenance work and of the complexity of the automatic apparatus and the unsatisfactory work, as yet, of the scientific-research institutes that are occupied with the questions of automation. The author presents concrete problems to the engineering and technical workers in the field of automation at coal mines.

TEXT: Institut po proyektirovaniyu i issledovaniyu
vzryvobezopasnogo elektricheskogo-oborudovaniya (Institute for
Design and Research of Explosion-proof Electric Equipment) has
planned development work on the following problems: 'barrier'
protection, new methods of protecting electric circuits and
electrical insulation, protection against explosions by the use
of loose and gas fillers, also contactless and arcless switching,
investigation and development of automatic equipment for spaces
in which there is danger of explosion. The solutions reached
will be applied to explosion-proof motors, transformers, mobile
sub-stations and other apparatus, as well as to electric drives

Periodical : Stan. i instr., 8, 12-16, Ag 1956

Abstract : The result of some experimental work at the Institute for Organization of the Machine-Tool and Instrument Industry (ORGSTANKINPROM) is presented by the author. Newly developed or re-designed machine tools, such as the 2A55 radial-drilling machine, which replaces the 255 model, the GF-210 three-spindle plano-milling machine, the 2A716 special diamond boring machine, the GF-200 seven-spindle plano-milling machine, and the 1S177 duplicate turning machine are described. More efficient assembly-line equipment and new conveyors for parts and whole machines in assembly are also described and illustrated. Nine photos and 4 drawings.

TITLE: Spectral representations in the quasioptical approach

SOURCE: Zhurnal eksper. i teoret. fiz., v. 46, no. 1, 1964, 339-353

TOPIC TAGS: elementary particle scattering, potential description of scattering, two particle unitarity condition, scattering amplitude, complex scattering potential, Mandelstam representation, dispersion relations, one dimensional dispersion relations, crossing symmetry

ABSTRACT: In an attempt to unify the potential description of elementary particle scattering with the two-particle unitarity condition, the analytic properties of the scattering amplitude as a function of the energy and the momentum transfer are investigated in the quasioptical approach, i.e., formulated as a potential scattering problem with a complex potential and an equation that implies

Card 1/3

ACCESSION NR: AP4012562

the relativistic two-particle unitarity condition. The approach is similar to that used by B. A. Arbuzov et al. (Preprint, OIYaI R-1318; ZhETF, in print), and the Fredholm series method is used. It is shown that the two-particle unitarity condition of quantum theory is incompatible in the framework of the quasipotential approach with the requirement of maximal analyticity in the form of the existence of a Mandelstam representation, but the total scattering amplitude admits of one-dimensional dispersion relations in each variable, with the other variables maintained fixed within a certain range. The effect of crossing symmetry is considered. In conclusion the authors express sincere gratitude to N. N. Bogolyubov who called their attention to the importance of this problem and also to N. N. Bogolyubov, A. A. Logunov, A. N. Tavkhelidze, V. S. Vladimirov, and O. I. Zav'yalov for fruitful discussions. Orig. art. has: 48 formulas.

TITLE: Anion-exchange adsorption of gadolinium and europium by IRA-400 amberlite
from water-methanol solutions containing neutral nitrates.

SOURCE: Radiokhimiya, v. 8, no. 2, 1966, 183-189

TOPIC TAGS: gadolinium, europium, nitrate, samarium, promethium, adsorption, ion exchange chromatography

ABSTRACT: The study was made in order to obtain data for a method of separating light radioactive rare earth elements for purposes of nuclear spectroscopy from gadolinium targets bombarded with 680 MeV protons. Most interesting among the products of the nuclear reaction are isotopes with the relatively short half-life of 0.5-5 hr, whose rapid chromatographic separation made it necessary to work with systems in which the distribution coefficients were small. Systems of this type were investigated by studying the anion-exchange adsorption of radioactive gadolinium and europium (obtained from a tantalum target irradiated with 680 MeV protons) on the strongly basic resin IRA-400 in the nitrate form from water-methanol solutions. The effect of nitrate cations (H^+ , Li^+ , NH_4^+ , Na^+ , Be^{2+} , Ca^{2+} , Mg^{2+}), temperature, and

concentration of the nitrate salt on the distribution coefficients and separation factors of Gd and Eu was determined. It was established that eluents containing methanol and neutral nitrates make it possible to perform the anion-exchange separation of Gd and Eu. Preliminary data on a method of separating light rare earths (Eu, Sm, and Pm) in a carrier-free state from macroquantities of Gd bombarded with 680 MeV protons are presented. Orig. art. has: 8 figures and 3 tables.

TITLE: The synthesis and investigation of polycarbonates by the interfacial polycondensation method. 5. Effect of the amount and concentration of sodium hydroxide on the course of the interfacial polycondensation of 2,2'-bis-(4-hydroxyphenyl) propane and phosgene

SOURCE: Vy'sokomolekulyarnye soyedineniya, v. 6, no. 3, 1964, 463-469

TOPIC TAGS: polycarbonate, dihydroxydiphenylalkane, 2,2'-bis-(4-hydroxyphenyl) propane, phosgene, polyester, sodium hydroxide, polycondensation, interfacial polycondensation, aqueous phase, organic phase, phenoxide ion, macromolecule

ABSTRACT: Equimolecular amounts of 2,2'-bis-(4-hydroxyphenyl) propane (HPP) and phosgene (in 0.01 - 1.0 mole/liter concentrations) were subjected to interfacial polycondensation in the presence of an equimolecular amount of sodium hydroxide in the aqueous phase. Polymers of low molecular weight (2000-8000) were obtained, irrespective of the nature of the organic phase, while the addition of a 100-300% excess sodium hydroxide caused an increase in the molecular weight of the polymers.

Card 1/3 ✓

ACCESSION NR: AP4030362

the magnitude of which varied with the solvent. Thus, at 0.1 mole/liter concentrations of the reacting components, an organic phase of carbon tetrachloride yielded a polycarbonate with a molecular weight of 65 000, as against a maximum of only 40 000 from an n-heptane phase and 10 000 and 7 800 from benzene and methylene-chloride phases, respectively. The yield of polycarbonates increased with higher concentrations of sodium hydroxide, reaching in carbon tetrachloride and n-heptane phases a maximum coinciding with maximum molecular weight, declining thereafter. In benzene and methylenechloride phases, on the other hand, the yield continued to climb long after the maximum molecular weight had been reached. It was also found that the degree of phosgene hydrolysis increased with higher concentrations of sodium hydroxide and that it depended on the nature of the organic phase. A 10-30% excess phosgene over the equimolecular ratio proved beneficial in achieving optimal yields and molecular weights of the polymers. While further additions of phosgene continued to increase the yield of the polycarbonate, its molecular weight declined. An excess of HPP over the equimolecular ratio with phosgene led to similar results. The authors conclude that a large excess of sodium hydroxide is required for optimal results in the HPP-phosgene interphase polycondensation reaction. Orig. art. has: 4 charts and 1 table.

TITLE: Activity of zinc sulfate in a sulfuric acid solution of zinc sulfate

SOURCE: Kohaszati lapok, no. 2, 1966, 69-73 27

TOPIC TAGS: sulfuric acid, zinc compound

ABSTRACT: The activity of the zinc sulfate at 25°, 35°, 45°, and 55°C in solutions containing 0.250 g./l. sulfuric acid and 0 - 175 g./l. zinc sulfate was investigated by determining the electromotive force of a galvanic element containing Hg_xZn_y/H_2SO_4 , $ZnSO_4$, $H_2O/Hg_2SO_4/Hg$. The electromotive force decreased with increasing sulfuric acid content, zinc content, and/or operating temperature. The activity of the zinc sulfate in the electrolyte increased with increasing sulfuric acid content, zinc content, and/or operating temperature. The results of the measurements performed were presented in Tables. Orig. art. has: 4 figures, 10 formulas and 9 tables. [JPRS]
